

Demonstration of Proposed Solution

HDI Prediction System — Project Demonstration Phase

Demonstration Objective

This session demonstrates the working HDI Prediction System, showing how a user can input four development indicators and instantly receive a predicted Human Development Index score through the deployed web application.

Demo Flow

- 1. Introduce the problem — the need for instant, on-demand HDI estimation.
- 2. Open the live application URL hosted on Render.com.
- 3. Enter sample values for Life Expectancy, Schooling years, and GNI per Capita.
- 4. Submit the form and show the predicted HDI score on the result page.
- 5. Repeat with a second, contrasting example to show the model responding to different inputs.
- 6. Briefly show the dark-themed UI and responsive layout.

Key Points to Highlight

- Model accuracy — R^2 score of approximately 0.98 on the training data.
- Speed — prediction returned within seconds of submission.
- Simplicity — only four inputs required from the user.
- Accessibility — publicly available link, no installation needed.

Sample Talking Points

"This tool takes the same indicators used by the UNDP to calculate HDI and lets anyone generate an instant estimate — turning a complex statistical process into a simple, one-click prediction."
